

ABSTRACT

A shoe is provided in which an external wrapper covers an outer surface of a midsole along at least a portion of a perimeter of the shoe. An upper assembly forms an external upper surface of the shoe. A wrapper locator abuts an inner surface of the external wrapper and includes an upper edge region extending above a top edge of the external wrapper. A lower edge region of the upper material overlaps the upper edge region of the wrapper locator. A lower edge of the upper material abuts an upper edge of the external wrapper. In this manner, the shoe construction is provided having a midsole wrapper that does not result in large ridges or bulky wrinkles.
